The Q compiles fine on windows, but the vendor prohibits #ifdef. uint_fast32_t foo(int arg) { #ifdef _LP64 return arg; #else return arg * 32; #endif } cannot compile because it asks the compiler to strip off the undefined symbol. I also tried __mips64 unsigned long foo(int arg) #ifdef __mips64 #define foo__ return arg; #else #define foo__ return arg * 32; #endif I get "function declared with a lambda-capture" error. A: The only way is to make a condition and define a macro #define foo(arg) \ ((__mips64) (arg)) uint_fast32_t foo(int arg) { return foo(arg); } uint_fast32_t foo(int arg) { #ifdef __mips64 return arg; #else return arg * 32; #endif } Another, verbose solution is to write your code as this: uint_fast32_t foo(int arg) { uint_fast32_t value = arg; #ifdef __mips64 return value; #else return value * 32; #endif } Serum response factor binding to the prostate-specific antigen

The electronic band structure of small graphite nanoplatelets with different lateral sizes and the mechanism of charge transfer at the graphene-graphite interface have been analyzed using first-principles calculations based on density functional theory and the local density approximation. The different physicochemical behaviors displayed by these systems can be explained by the electronic character of the interlayer interaction energies of the graphite nanoplatelets. The results show that the graphene-graphite interaction is dominantly electrostatic in nature, which is characterized by a positive charging of the graphene sheets with respect to the graphite layers. The charge transfer and the analysis of the orbital character of the carbon atoms indicate that the interaction takes place mainly through the π orbitals of the graphene layer, where the interaction of the charge with the interlayer graphene is found to be slightly stronger for larger lateral sizes.Q: Toggle validation error for a form with jQuery toggle() I'm having trouble with this form validation problem, there is a label that has the error shown as "THIS IS AN ERROR" but I want to make it show as "THIS IS OK" like below. What's New In Capture One?

Capture One is a modern photo editing program that is used to easily modify and edit RAW photos. This program will allow you to apply standard adjustments, such as color correction, sharpening, noise reduction, etc. Capture One is also able to convert RAW photos to a variety of image formats such as JPEG or TIFF. The large feature set allows users to make a number of advanced adjustments to the image's appearance. Basic adjustments such as exposure, contrast, and color can be made directly within the program. With respect to color, it is possible to make changes such as burn (darkening), sharpen, levels and tones, sepia, etc. The program also has the ability to merge multiple images into a single file, create PNG files for sharing on the Internet, or organize several images into a folder. If needed, some advanced adjustments can also be made such as perspective, distortion, lens corrections, lens flare, lens zooming and focus, etc. The program even has the ability to create a new camera profile or fix one that is already present. Lastly, it is possible to use the exposure mask on the image, create an exposure mask and even apply smart filters and selections. Many of these editing options can also be applied on JPEG images as well. For this purpose, the program will automatically detect any changes that are made to the raw file and will automatically apply these same changes to the JPEG image. If the chosen image has an existing profile, it will be loaded. There are also advanced options within the RAW and JPEG files, such as masking, merges, manual adjustments and RAW to TIFF conversion. These advanced options include edge detection, grain removal, unsharp masking, and sharpening. An interesting feature is "Speed Edit," which will allow you to create a photo by applying the adjustments you want quickly and easily.
